Interests

I develop and apply computational methods to study materials used in LEDs. LED bulbs are still very expensive compared to bulbs like incandescents and compact-fluorescents. I am trying to reduce that cost using supercomputers. My methods can predict properties that these materials have before an experimentalists has to go through the expensive and time consuming process of making the material in the lab. That time and money can be saved by my calculations, leading to faster discovery of materials that have desirable properties. With my calculations, I hope to find new materials that can be realized in the lab that will lead to more efficient and cheaper LEDs.

I also am focused on communicating science, both to technical and lay-audiences. This is just as important as doing good science. If no one understands what I am trying to do, I won't be able to get the support I need to do research. To gain experience with this, I have been involved with various K-12 and adult public engagement events. I have taught technical writing to other graduate students. I have written and edited with Michigan Science Writers. And I have sought out specific training to improve my skills, like the RELATE workshop series at the University of Michigan and the ComSciCon Workshop in Chicago.
